Wave-Particle Duality

the wavelength of o particle
de Broglie

$$
\lambda=h / \mathrm{mv}
$$

Heisenberg

$$
\begin{aligned}
& \text { with mass in t } \\
& \text { velocity v } \\
& \Delta x \Delta p_{x} \geq h / 4 \pi
\end{aligned}
$$

ex -

objects like people
$\lambda$ is very small
small eurgetce objects have a langer wavelength
https://en.wikipedia.org/wiki/Electron_diffraction\#/media/File:DifraccionElectronesMET.jpg
when the blamiltonian operator op
Squaring the wave function gives use the probability of finding a the electron at a given location in space the wave function comes back out + it is multiplied by the $\begin{aligned} & \text { The wave function must be an eigenfunction energy of the system } \\ & \text { English }\end{aligned}$

| Math-speak | English |
| :--- | :--- |
| 1. The wave function must be single valued. | Cannot have two probabilities for finding the <br> electron at a given point |
| 2. The wave function and its first derivatives <br> must be continuous. | The probability must be defined at all points <br> in space and cannot change abruptly |
| 3. The wave function must approach 0 as r |  |
| approaches infinity |  |$\quad$| The probability must get smaller at large |
| :--- |
| distances of the atom. The atom must be |
| finite. |

as distance approaches infinity $\varphi \neq \varphi$ approsechs

Schödinger Equation and the Hamiltonian Operator

$$
\begin{aligned}
& \text { tion and the Hamiltonian Operator } \\
& \mathrm{H}=\frac{-h^{2}}{8 \pi^{2} \mathrm{~m}}\left(\frac{\delta^{2}}{\delta \mathrm{x}^{2}}+\frac{\delta^{2}}{\delta \mathrm{y}^{2}}+\frac{\delta^{2}}{\delta \mathrm{z}^{2}}\right)-\frac{\mathrm{Z} e^{2}}{4 \pi \varepsilon_{0} \sqrt{\mathrm{x}^{2}+\mathrm{y}^{2}+\mathrm{z}^{2}}} \psi
\end{aligned}
$$

Since,

$$
\begin{aligned}
E & =K E+P E \\
& =\frac{1}{2} m v^{2}+\frac{z q 9}{5} k \\
& \frac{m^{2}}{s^{2}}
\end{aligned}
$$

$$
\frac{\left(\text { charge } e^{-}\right) \cdot(\text { nuclear charge })}{\text { constants }}
$$

$$
\begin{aligned}
& \text { KEy } r=\sqrt{x^{2}+y^{2}+z^{2}} \\
& H=\left[\frac{-h^{2}}{8 \pi^{2} m}\left(\frac{\delta^{2}}{\delta x^{2}}+\frac{\delta^{2}}{\delta y^{2}}+\frac{\delta^{2}}{\delta z^{2}}\right)\right]
\end{aligned}
$$

So the electron is a particle/wave trapped in an atom...
model any wave

my particle in the wall? 0 so wave function at $x=0$ must be 0

So the electron is a particle/wave trapped in an atom...

$$
\Psi=\mathbf{A} \sin \mathbf{r x}
$$

simplified because our particle 15 not charged, so no contribution to E from Couloonbs law.

$$
\begin{aligned}
& \frac{-h^{2}}{8 \pi^{2} m}\left(\frac{\delta^{2}}{\delta x^{2}}(A \sin r x)\right)=E(A \sin r x) \\
& \frac{-h^{2}}{8 \pi^{2} m}(\operatorname{Ar})\left(\frac{\delta}{\delta x}(\cos r x)\right)=E(A \sin r x) \\
& \frac{-h^{2}}{8 \pi^{2} m}\left(-A r^{2}\right)(\sin r x)=E A \sin r x
\end{aligned}
$$

So the electron is a particle/wave trapped in an atom...

$$
\begin{aligned}
& \frac{-h^{2}}{8 \pi^{2} m}\left(-A r^{2}\right)(\sin r x)=E \text { A } \sin r x \\
& \frac{-h^{2}}{8 \pi^{2} m}\left(-r^{2}\right)=E \\
& r^{2}=E \quad \frac{8 \pi^{2} m}{h^{2}} \\
& r=\frac{2 \pi}{h} \sqrt{2 m E}
\end{aligned}
$$

So the electron is a particle/wave trapped in an atom...

$$
\mathrm{r}=\frac{2 \pi}{h} \sqrt{2 \mathrm{mE}}
$$

must he 0 .
The particle canst exit in the can wall.
the energy is quantized
because she fare function nab many tn's where the function goes to 0.

$$
\begin{aligned}
\Psi & =\mathrm{A} \sin \mathrm{rx} \\
\mathrm{r} & =n \frac{\pi}{a} \\
\Psi & =\mathrm{A} \sin \left(n \frac{\pi}{a} \mathbf{x}\right)
\end{aligned}
$$

So the electron is a particle/wave trapped in an atom...

$$
\begin{gathered}
\Psi=A \sin \left(n \frac{\pi}{a} x\right) \\
\left(\Psi \Psi^{*}\right)=1 \\
\Psi=(2 / a) 1 / 2 \sin (n \pi / a) x
\end{gathered}
$$

The Aufbau Principle

1. start in lowest quantum levels
2. Pauli exclusion principle---comes from experiment, not the Schrödinger Equation
3. Hund's Rule of Multiplicity--Multiplicity is the number of unpaired e-s +1

Factors determining the energy of the electron
Penetration and effective nuclear charge
$\Pi_{\mathrm{c}}=$ coulomb repulsion
-bad
-number of paired electrons

## The Aufbau Principle

1. start in lowest quantum levels
2. Pauli exclusion principle---comes from experiment, not the Schrödinger Equation
3. Hund's Rule of Multiplicity--Multiplicity is the number of unpaired $e^{--} \mathrm{s}+1$

Penetration/effective nuclear charge
$\Pi_{\mathrm{c}}=$ coulomb repulsion

- bad
- number of paired electrons
$\Pi_{\mathrm{e}}=$ exchange energy
- good in the case of parallel electrons in an atom
- number of exchanges that can be made and produce identical electron configurations

Exchange energy is NOT the exchanges between all possible arrangements (states). Rather, it is the number of possible exhanges of electrons in a single state; thus,
